

Google Play Store Analytics Dashboard Solution Approach

1. Problem Statement

Analyze Google Play Store app data to identify factors affecting app success, ratings, installs, reviews, pricing, and user engagement using Power BI.

2. Data Collection

Imported googleplaystore.csv and googleplaystore_user_reviews.csv into Power BI.

3. Data Cleaning

Removed duplicates, handled missing values, converted Rating, Reviews, Installs, Price and Date columns to appropriate data types, cleaned text fields, and created relationships.

4. Data Modeling

Created a one-to-many relationship between App tables and built DAX measures for Total Apps, Total Installs, Average Rating, Reviews, Free Apps and Paid Apps.

5. Dashboard Development

Designed KPI cards, Apps by Category, Content Rating Treemap, Free vs Paid Donut Chart, Top Installed Apps, Rating vs Reviews Scatter Chart, and interactive slicers.

6. Business Insights

Identified popular categories, highest installed apps, free vs paid distribution, content rating distribution, and user engagement trends.

7. Recommendations

Focus on high-performing categories, maintain high ratings through updates, optimize app size, encourage reviews, and use data-driven pricing strategies.

8. Tools Used

Power BI, Power Query, DAX, Data Modeling, CSV datasets.
